

Farmers build their own solar power

Solar power is the fastest growing source of electricity in the U.S., but some new solar installations are taking over productive farm ground. Scientists are trying to develop ways to get...

Solar energy is leading the way, with much of the new development occurring on farmland and in rural communities. It has the potential to be a financial opportunity for landowners, yet it can ...

This farmer-centered approach ensures that the land under the solar array is actively used for agriculture, helping to mitigate the loss of farmland. One notable benefit of agrivoltaics is that it ...

Enter agrivoltaics: an innovative approach that allows solar panels and crops to share the same land, offering a lifeline to farmers while advancing clean energy goals.

Solar is helping farmers in California save water and secure reliable income in the face of drought and economic pressure.

Agrivoltaics -- the practice of combining solar energy with agricultural production -- proves that farmers don't have to take all their land out of production to use solar panels.

Agrivoltaics merges agriculture with photovoltaic panels, which generate electricity from sunlight. The combo produces clean energy and edible crops.

Can farmers make their own fertilizer, fuel and electricity from the sun? Welcome to TrackerSled, a pop-up 3.5-acre solar farm intended to provide energy independence and profit potential.

Agrivoltaics is the combination of agricultural production (which converts sunlight to food) with solar photovoltaic technology (which converts sunlight directly into electricity). The practice...

By producing their own clean electricity, farmers can protect their livelihoods from an increasingly strained grid. Many farmers across America are choosing solar for its reliability and ...
