

Photovoltaic panel slope water tank

Does a photovoltaic panel reduce runoff and sediment in a slope?

The impact of a photovoltaic (PV) panel on runoff and sediment in a slope was tested. The key impact of the PV panel is preventing soil detachment by raindrop impacts. The PV panel slope produced 27 %-63 % less soil erosion than the control slope. The PV panel delayed runoff start time under rainfall with heavy rainfall intensities.

What is the difference between a control slope and a PV panel?

On the contrary, under heavy rainfall with 80 mm hr⁻¹ or 100 mm hr⁻¹ intensity, the runoff start time of the PV panel slope was later than the control slope. The rain water quickly filled the depressions and converged into overland flow on the control slope.

Which slope is suitable for PV power plant installation?

Hillslope areas contain a large portion of land which is suitable for large-scale PV installations (Fig. 1) (Kim and Park,2021,Yang et al.,2019),and there is a wide range of acceptable slopes for PV power plant installation (from 5 to 11.3°) (Anwarzai and Nagasaka,2017,Charabi and Gastli,2011,Irena,2013,Yushchenko et al.,2018).

Why did a PV panel erode a slope section?

This was attributed to the weakened splash erosion on the slope section under the PV panel due to the rainfall interception by the panel,which indicated that the key impact of the PV panel was preventing soil detachment by raindrop impacts.
